Ten years building consumer internet products for global markets at Baidu, OnePlus and OPPO. Today I own OPPO's overseas lockscreen magazine, a platform with **200M daily active users**, roughly 1B daily impressions and **USD 70M in annual revenue**, where the roadmap and the P&L are mine. Some of the content we produce ourselves, the rest comes from third-party partners; we run monetisation and share the revenue back with them.

A team can only do so much on its own. Package a capability as a product, put it in partners' hands, and you get far more people and far more experiments than the team could ever run itself. I built two of these for our content partners: a console that shows them how their own content is doing, and an **A/B slot** they can run their own topic tests in. That is how they discovered winning categories: entertainment in Thailand, wedding season in India.

On the user side, the whole content chain runs as **AI agents**, from production through grading and tagging to curation. In-house supply went from nothing to **150,000 images and 3.9M multilingual articles** in a quarter, and themed sets lifted per-user page views and click-through by **5-8%**.

Earlier I ran partnerships with the leading **e-commerce and online service platforms** in these markets, bringing Lazada, Shopee, Grab and Gojek into OPPO's Minus One Screen (the panel one swipe left of home). Cross-platform price comparison there hit **30% click-through**, against about 15% for everything else in the same slot. English is my working language, and this role at Zalando is close to what I already do: building discovery capabilities that partners can pick up and use themselves.

A team can only do so much on its own. Package a capability as a product, put it in partners' hands, and you get far more people and far more experiments than the team could ever run itself.

Own the roadmap and P&L for a platform with **200M daily users** across 60+ countries, roughly 1B daily impressions and **USD 70M in annual revenue**. Daily users grew **104%** and revenue **78%** year over year.

- **A console that shows partners how their content is doing.** Every item goes back to the partner who supplied it with its AI-assigned attributes, art style and quality tier attached, alongside impressions, click-through and ad revenue. Partners can see what is working and change what they send us.
- **An A/B slot, opened up to partners.** Delivery is interleaved, so a content theme could never be tested cleanly. Reserving the first slot after a swipe for one theme gives the test group a consistent experience and a clean read against control. Partners ran their own tests here and found categories like entertainment in Thailand and wedding season in India, delivering **10% higher click-through** month over month, which then shaped regular supply.
- **Production, grading and tagging as agents.** In-house supply went from nothing to **150,000 images and 3.9M multilingual articles** in a quarter. Every item is graded against SABD, our four-tier quality standard, before it reaches the library; anything short of the bar goes back to a generative model and is reviewed again. Tagging against **1,319-node** taxonomies runs at **90% accuracy** and took classification from 1,000 items a week by hand to 1,000 a day. Top-tier items are now **30%** of the library.
- **Curation as an agent.** Specified as a product document, the curation agent groups single images into themed sets, replacing roughly 100 hand-curated sets a week with **300 to 500 a day** and lifting per-user page views and click-through by **5-8%**. Delivery then moved from random rotation to in-house personalisation, built with the data science team, for another **12%**.

Head of Partnerships and
Localised Operations,
Overseas
OPPO • Shenzhen

No single app can fix a cross-app problem. In partnerships with e-commerce and online service platforms the value is not the placement. It is using what only the phone can do, to solve what they cannot solve from inside their own app.

Partnerships between OPPO's own surfaces and the leading overseas **e-commerce and online service platforms**.

- **Cross-platform price comparison, built into a system surface.** Local research kept pointing at the same unmet need: people were opening app after app to compare prices. We built comparison into the Minus One Screen, covering goods from Lazada and Shopee and rides from Grab and Gojek. It reached **30% click-through** against about 15% for everything else in that slot, and became a template new e-commerce and online service partners can plug straight into.
- **A partner card that predicts instead of promotes.** With Grab, we built a Minus One Screen card off system signals: it suggests booking when rain is due within two hours, warns when rides are about to get scarce at the end of the working day, and puts the driver's plate number and trip progress on the lockscreen so nobody has to unlock. Click-through went from **2% to 9%**, the highest of any card on that surface. Grab's install share on OPPO devices rose from **16% to 19%**, and the card became a launch feature of the Reno11 global release.

2022 – 2023

Head of Global
Game Publishing
OPPO · Shenzhen

Partners want to integrate once and appear everywhere; the team wants integrations that don't require dedicated headcount. Build both into the platform and team size stops deciding how many partners you can serve.

- **One publishing platform instead of scattered inventory.** Browser, lockscreen magazine, Theme Store and messaging inventory came together as a single platform, so a partner integrates once and reaches every surface. Concurrent titles went from 4-5 to **30-50**, and single-title daily impressions from 70M to **220M**.
- **Onboarding as self-serve tooling.** Scheduling, creative libraries, placement configuration and attribution setup became tools partners operate themselves, cutting onboarding from about two weeks of manual coordination to a **five-working-day** process.

2019 – 2022

Product Owner
OnePlus Games
OnePlus · Shenzhen
Gaming line within
OxygenOS

- Built OnePlus Games from nothing into a content product preinstalled on three phone brands, taking DAU penetration from **3% to 13%** in six months; an in-app community fed by YouTube and Twitch lifted daily content interaction from **10% to 30%**.
- Partnered with **Epic Games** on Fortnite: the Epic Games app sat inside OnePlus Games with a high frame rate mode, and we cut the long post-install resource download **by about a third** with accelerated, split and pre-downloads. The feature went on stage at a phone launch and was marketed jointly with Fortnite.

2016 – 2019

Product Manager
Baidu International R&D
Center
Shenzhen

Facemoji Keyboard, **20M daily active users** across 150+ countries: owned the gaming keyboard and Hindi voice input, and improved ad monetisation for international web products.

02 INDEPENDENT BUILDS · AI-NATIVE

AI extends how far one person can reach. The judgment is still yours.

apprundown.com

Discovery site for one-time-purchase apps · 2026

200+ daily unique visitors
90% from the US and Europe

- **Finding the real need.** It took three pivots: iOS ranking reviews on Sensor Tower data, then price-drop tracking, then one-time-purchase apps, which caught North American users' subscription fatigue. Rating recency and update frequency are weighted into a trust score that **drives the ranking**.
- **Built end to end with AI.** Claude Code carried it from requirements through technical design, implementation and two rounds of AI code review; the first usable version shipped from my phone in **seven days**, with GitHub, Supabase, Vercel and Cloudflare behind deployment.
- **Grown without paid channels.** Search Console and GA4 for SEO, scripted backlink prospecting, automated outreach through Gmail, and posts written for each Reddit community rather than at it: **200,000 views** on one of them and a peak of nearly 1,000 visitors in a day.

03 CREDENTIALS

CORE SKILLS

Commerce and content discovery platforms · personalisation, recommendation and ranking · partner-facing platform capabilities and self-serve tooling · LLM, computer vision and information retrieval · A/B experimentation and metrics · user research and product discovery · product strategy and roadmap · cross-functional delivery with data science, engineering and design

AI PRACTICE

Claude Code · Codex · agent workflows · custom agent skills for internal workflows · AIGC image production · SQL/Hive

LANGUAGES

Mandarin (native) · Cantonese and English (professional working) · Hindi (limited working)

EDUCATION

Guangdong University of Foreign Studies, Bachelor's degree 2012 – 2016
China-India Government Exchange Scholarship, New Delhi 2015
